API Overview

The NXGEN API provides programmatic access to your monitoring platform. Build custom integrations, automate workflows, and extend NXGEN capabilities with our comprehensive REST and GraphQL APIs.

Introduction

NXGEN offers a modern, well-documented API that enables you to integrate monitoring capabilities into your existing systems. Whether you're building a custom dashboard, automating alert responses, or syncing data with external tools, our APIs provide the flexibility you need.

Authentication Methods

NXGEN supports multiple authentication methods to secure your API access:

API Key Authentication

API keys are the simplest way to authenticate. Generate keys from your account settings and include them in the X-API-Key header. Keys can be scoped to specific permissions and organizations.

OAuth 2.0

For third-party applications and user-authorized access, use OAuth 2.0. This provides fine-grained permission control and secure token-based authentication with automatic refresh.

JWT Bearer Tokens

After initial authentication, you'll receive a JWT bearer token. Include this in the Authorization header for subsequent requests.

Rate Limits

API requests are rate-limited to ensure fair usage and platform stability. Limits vary by endpoint and authentication method.

Available SDKs

Official SDKs are available for popular programming languages including JavaScript/TypeScript, Python, Go, Java, C#/.NET, and PHP.

Next Steps

Ready to start integrating? Check out the REST API Reference, GraphQL API, Webhooks, and SDK Documentation sections.
