# Redundancy Filter in Genesis: What It Does and Why It Matters

## What is the Redundancy Filter?

The **Redundancy Filter** is a built-in feature in Genesis that helps prevent a flood of similar alarms from the same camera or sensor being sent repeatedly to the cloud. It ensures that only **one alarm** is sent within a specific time window — by default, **30 seconds**.

This feature helps operators focus on meaningful alerts without being overwhelmed, and reduces unnecessary cloud traffic, bandwidth, and storage usage.

---

### 🎯 Why is this useful?

- ✅ Avoids alert fatigue for operators
- ✅ Prevents cloud overload with duplicate alarms
- ✅ Ensures alarms sent are **actionable and meaningful**
- ✅ Helps maintain system performance and bandwidth

---

## 🔍 How does it work?

Let's say the redundancy filter is set to **30 seconds**:

1. A camera or sensor sends a video alarm to Genesis.
2. Genesis accepts the **first alarm**.
3. If another alarm from the **same camera** with the **same alarm code** is received within **30 seconds**, it will be **automatically rejected**.
4. After the 30-second window ends, a new alarm from that camera will again be accepted.

This logic is applied **per camera**, so each stream is handled independently.

---

## 🧠 Example

- 12:00:00 → Camera A sends motion alarm → ✅ Accepted
- 12:00:20 → Camera A sends another motion alarm → ❌ Rejected
- 12:00:31 → Camera A sends another motion alarm → ✅ Accepted

---

## ⚠️ Important Notes for Device Configuration

- Devices should be configured to **not send alarms too frequently**, especially if the alarm logic is sensitive (e.g., movement, line crossing).
- Genesis does **not block alarms at the device** — only at the cloud ingest stage — so **local device logs may still show all events.**

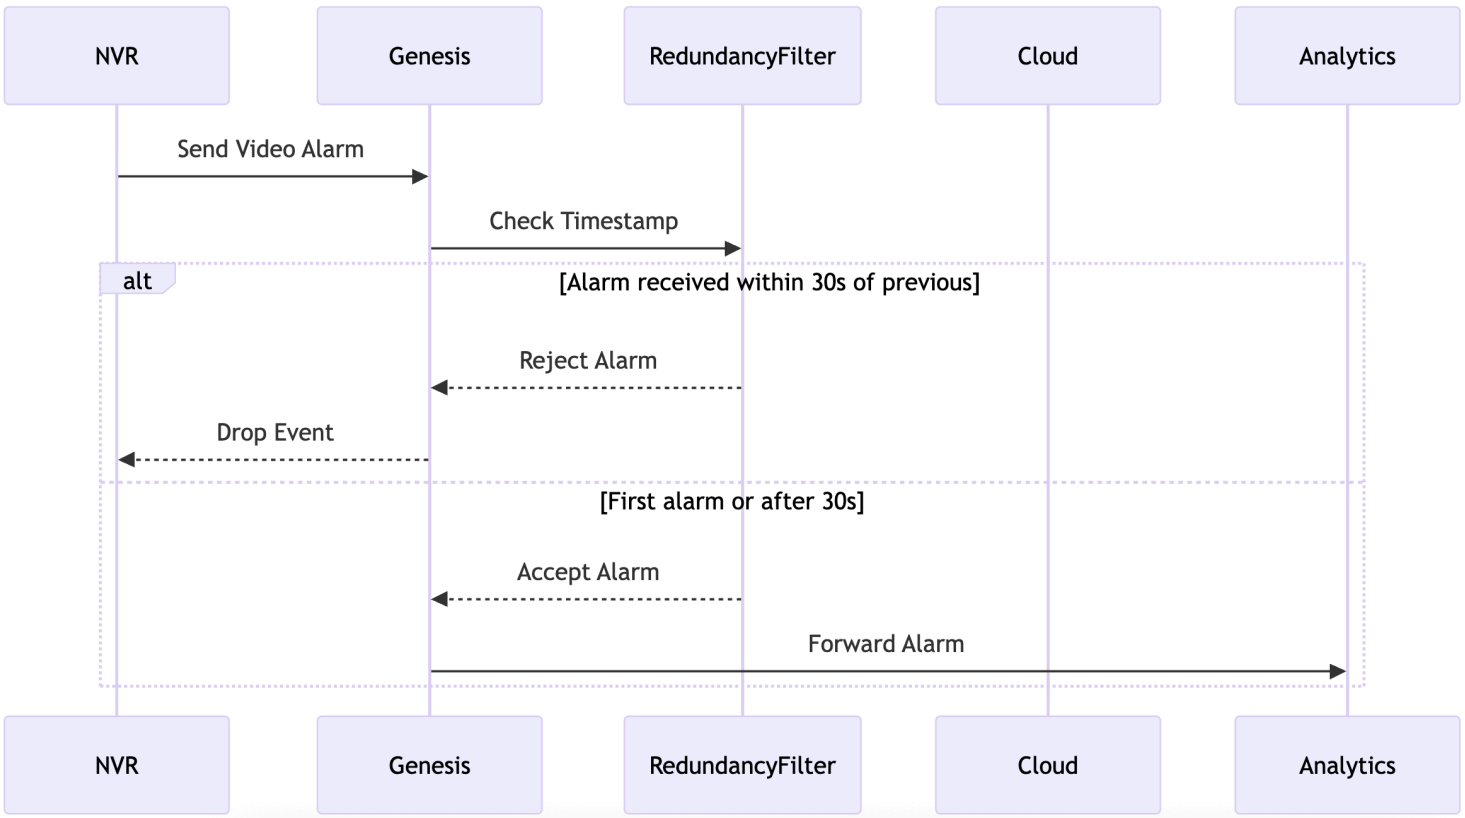
---

## 📷 Visual: Redundancy Filter in Simple Terms

We'll add a diagram like this for user understanding (replace with the actual uploaded graphic or illustration):

---

### 🔁 Redundancy Filter Illustration



Only **1 alarm per camera every 30 seconds** is forwarded to the operator or ARC team.

---

## 🛠️ Can the timer be changed?

Yes. The redundancy timer is **configurable per integration or device type**. If you believe the default 30 seconds is too long or too short, contact support to review your setup.
