Local Mode Configuration

Local Mode Configuration

To leverage P2P streaming and local SDK features, the Local Mode service must be installed on every operator workstation.

Installation Steps

1. Download the Installer: Obtain the latest Genesis Installer (v.2.8.2 or later)
2. Run as Administrator: Right-click Genesis-Installer.exe and select Run as Administrator
3. Follow On-Screen Instructions: Complete the wizard to install the Local Mode service components
4. Verify Service: Ensure the Genesis Local Mode service is running in the Windows Services manager (Services.msc)

Enabling Local Mode in GCXONE

Once the service is installed locally, you must ensure it is enabled in your platform settings:

1. Navigate to the Configuration App
2. Go to Sites and select your target site
3. Under the Settings or General tab, ensure the Enable Local Mode toggle is active

Troubleshooting Connectivity

If Local Mode features such as P2P streaming are not working:

- Ping Test: Verify the workstation can reach the NVR or Device IP
- Port Check: Ensure local firewalls allow traffic on the device's SDK ports such as 80, 8000, and 37777
- Service Refresh: Restart the Genesis Local Mode service on the workstation

Important: Local Mode settings are NOT required for Genesis Audio (SIP) calls, as they are initiated directly via the cloud.
