HealthCheck

HealthCheck

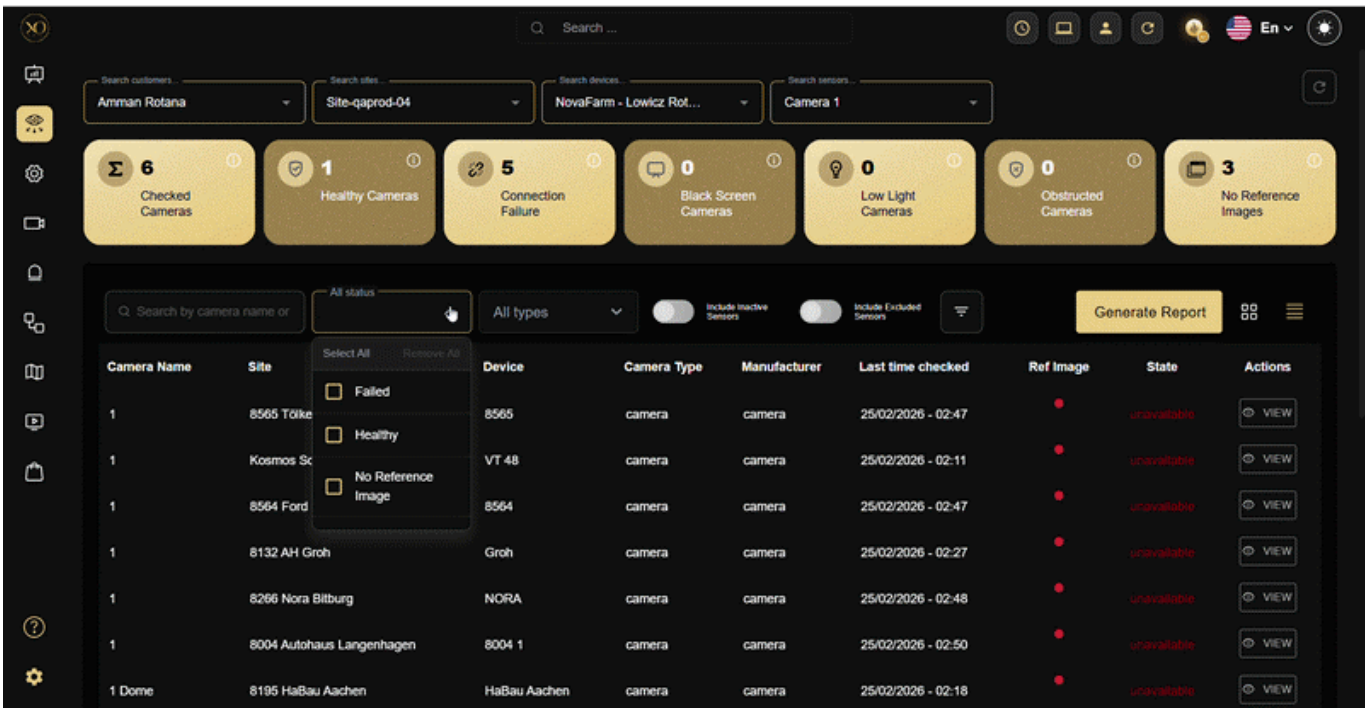
HealthCheck provides visibility into the operational status of devices connected to the platform. It helps users monitor device conditions and quickly identify issues that may affect system performance.

How It Works

HealthCheck continuously evaluates the operational status of connected devices by analyzing device responses and system signals. The platform then categorizes device conditions and displays the results through health indicators.

HealthCheck Interface

GIF



The HealthCheck interface displays device status information and summarizes the overall condition of connected devices across the platform.

Device Status

HealthCheck evaluates devices and reports their operational condition using the following status indicators:

- **Healthy** — The device is operating normally
- **Failed** — A problem has been detected affecting device operation
- **Unavailable** — The device is currently not reachable or not providing data

These indicators help operators quickly identify devices that may require investigation.

HealthCheck Controls

Users can filter and review device health information using the following options:

- Searching for specific devices
- Filtering by device status
- Filtering by device type

These controls help users focus on the devices or conditions most relevant to their monitoring tasks.
