TowerGuard

TowerGuard

TowerGuard provides monitoring and protection capabilities for tower infrastructure. It enables users to supervise tower sites and detect potential security or operational issues.

How It Works

TowerGuard monitors tower infrastructure by collecting data from connected devices deployed at tower locations. The platform analyzes operational signals and alerts users when abnormal conditions or security events are detected.

TowerGuard Interface

gif

The interface displays tower locations and associated monitoring information, allowing operators to observe tower activity and investigate potential incidents.

Key Capabilities

TowerGuard enables users to:

- Monitor tower infrastructure
- Review related alarm activity
- Access device and site information
- Investigate potential security events

Operational Value

TowerGuard improves infrastructure security by providing visibility into tower operations and enabling faster response to potential incidents.
