User Management Setup

User Management Setup

GCXONE uses a **Role-Based Access Control (RBAC)** system to manage user permissions across the platform. Access is defined through roles, module privileges, and entity assignments — controlling what actions users can perform and which customers, sites, devices, or sensors they can access.

Step 1: Review Default Roles

GCXONE provides predefined roles to simplify initial configuration:

- **Super Admin** — full platform control across all modules and entities
- **Admin** — administrative access for user management, configuration, and reporting
- **Operator** — operational monitoring and alarm handling
- **Installer** — device and sensor configuration access
- **End User** — read-only access to dashboards, reports, and assigned devices

These roles can be used directly or customized depending on operational requirements.

Step 2: Create or Modify Roles

Navigate to **Settings** → **Roles**

From this page you can:

- Create new roles
- Modify existing roles
- Configure module privileges
- Define entity access for customers, sites, and devices

Step 3: Invite Users

Navigate to **Settings** → **Users** and invite users by email.

During the invitation process:

- A role is assigned to the user
- Module privileges are inherited from the assigned role
- Entity access is applied based on role configuration

After invitation, users receive an email with instructions to activate their account and access the platform.

Next Step

After configuring roles and inviting users, proceed with **Device Integration & Testing** to add and validate devices within the platform.

For detailed RBAC configuration and role management, refer to **User Management**.
