What is GCXOne

What is GCXONE?

GCXONE is an AI-powered, cloud-native security operations platform that unifies video surveillance, alarm management, and IoT monitoring into a single intelligent interface — without requiring any local infrastructure.

It is designed for security operations centers, service providers, and enterprises that need to monitor multiple sites, manage alarms efficiently, and scale their operations without complexity.

The Problem GCXONE Solves

Traditional security operations struggle with:

- **Alarm fatigue** — high volumes of false alarms that overwhelm operators
- **Slow investigations** — manual workflows that delay response
- **Blind spots** — cameras going offline unnoticed
- **Complex onboarding** — adding new customers and sites takes too long
- **Limited visibility** — no unified view across distributed locations

GCXONE was built specifically to solve these challenges.

How GCXONE Works

1. **Devices send events** — cameras, sensors, VMS systems, and alarm panels connect to GCXONE
2. **AI filters and classifies** — irrelevant events are removed, real threats are prioritized
3. **Operators take action** — verified alarms are presented with video context and clear workflows
4. **Alarms are resolved** — through assignment, escalation, reporting, and audit trail

What GCXONE Delivers

Reduce Alarm Fatigue

AI-driven filtering reduces false alarms by up to 99%, so operators focus only on genuine threats — not noise.

- **NOVA99x** — filters out wind, shadows, and animals
- **Behavioral Analysis** — detects anomalies in system health and user access patterns
- **Proactive Mitigation** — identifies risks before they escalate into incidents

Improve Operational Efficiency

- **ZenMode** — compiled alarm summaries for faster review
- **Universal Search** — find anything instantly
- **Automated Triage** — automation resolves routine service requests, reducing manual overhead by up to 70%
- **Role-based dashboards** — each user sees only what is relevant to them

Increase Uptime

Health Check proactively monitors device connectivity, black screen detection, obstruction, and low-light conditions — catching issues before they impact operations.

Enable Scalable Growth

- **Bulk Import** — onboard customers and sites at scale
- **Tower Guard** — centralized mobile tower monitoring
- **Marketplace** — activate features instantly without deployments

Platform Architecture

GCXONE runs on a secure **multi-tenant SaaS architecture**, meaning each organization's data is fully isolated, secure, and accessible only to authorized users.

The platform hierarchy:

- **Tenant** — the service provider or top-level organization
- **Customer** — end-client organizations managed by the tenant
- **Site** — physical locations belonging to a customer
- **Device** — cameras, sensors, and panels at each site
- **Sensor** — individual detection points on a device

Multi-Level Operational Control

- **Service Provider Level** — full visibility across all customers
- **Customer Level** — oversight of all sites and devices
- **Site Level** — real-time monitoring of a specific location
- **Device Level** — individual device health and event history

Role-Aware by Design

Every user sees only the modules, dashboards, and entities relevant to their role. Access is controlled through structured role configuration and entity-level permissions — ensuring clarity, security, and efficiency.

- **RBAC** — granular Role-Based Access Control

- **Audit Trails** — comprehensive logging of all system activity for compliance needs

AI at the Core

GCXONE includes **Genie**, an embedded AI assistant that:

- Answers operational questions in plain language
- Provides analytics and performance insights
- Assists with troubleshooting
- Integrates with ticketing systems and workflows

Integration with TALOS

GCXONE works alongside **Evalink TALOS** as part of a complete operational workflow. GCXONE handles AI filtering and alarm prioritization — only validated alarms are forwarded to TALOS for structured operator handling and escalation.

Technology Foundation

- **Deployment** — 100% cloud-based, zero on-premise hardware
- **Uptime** — 99.9% SLA on AWS infrastructure
- **Encryption** — end-to-end, data encrypted at rest and in transit
- **Compliance** — ISO 27001 certified
- **Integration** — REST APIs and webhooks for third-party systems
- **Device Support** — 200+ manufacturers including Hikvision, Axis, Dahua

ROI & Business Value

- **Total Cost of Ownership** — 40% reduction by eliminating server and maintenance costs
- **Administrative Time** — 70% saved through automation and unified UI
- **Incident Response** — 50% faster with real-time AI alerts and triage
- **CapEx Investment** — zero, fully cloud-based deployment
