Browser Errors

🍪 Resolving Browser Cookie Errors

If you can access the Genesis Dashboard but receive an **"Oops something went wrong"** message when clicking on **Alarm Management** or **Workflows**, the issue is almost certainly your browser's security settings.

🔍 The Root Cause

Talos is an **embedded application**. It runs inside the Genesis interface but communicates with a separate security backend. To maintain your session across these two domains, your browser must allow **third-party cookies**.

🛠️ How to Fix: Quick Toggle

The fastest way to fix this is using the address bar toggles:

1. Look at the right side of your **Browser Address Bar**.
2. Click the **Eye icon** (👁️) or **Cookie icon**.
3. Toggle the switch to **"Allow Third-Party Cookies"** for this site.
4. Refresh the page.

⚙️ Manual Browser Settings

If the quick toggle isn't visible, use the manual settings for your specific browser:

1. Go to `Settings` → `Privacy and Security` → `Third-party cookies`. 2. Select **Allow third-party cookies**. 3. *Alternatively:* Add `[*.]nxgen.cloud` and `[*.]evalink.io` to the **"Allowed to use third-party cookies"** list. 1. Go to `Settings` → `Cookies and site permissions`. 2. Ensure **"Allow sites to save and read cookie data"** is On. 3. Ensure **"Block third-party cookies"** is Off. 1. Go to `Settings` (or Preferences) → `Privacy`. 2. **Uncheck** "Prevent cross-site tracking". 3. **Uncheck** "Block all cookies".

💡 Troubleshooting Checklist

- **Incognito Mode:** If Talos works in Incognito, clear your regular browser cache.
- **Ad-Blockers:** Some ad-blockers (like uBlock Origin) treat Talos cookies as "trackers." Whitelist the site in your extension settings.
- **Corporate VPN:** Some VPNs strip cookie headers. Try connecting from a direct internet line to rule out network-level blocking.
