GCXONE & Talos Interaction

GCXONE & Talos Interaction

GCXONE acts as the Intelligent Processing Layer for Talos. While Talos handles core alarm distribution and operator workflows, GCXONE provides the computer vision and AI needed to verify threats, manage video streams, and synchronize site metadata across the ecosystem.

Automatic Site Synchronization

When an administrator creates a site in GCXONE, the platform automatically generates a corresponding record in Talos via MQTT messaging.

Bidirectional Sync: Updates to site names, addresses, or contact details in GCXONE are pushed to Talos in real time.

Test Mode Intelligence: If a site in Talos is set to Test Mode during maintenance, GCXONE automatically disarms that site to prevent unnecessary AI processing.

The Alarm Lifecycle

The most critical interaction between GCXONE and Talos occurs during a security event. The flow works as follows:

Detection: A hardware device detects a breach and sends a signal to Talos.

Forwarding: Talos uses a pre-configured workflow to forward images or video clips to the GCXONE AI engine.

Verification: GCXONE's AI classifies the event based on configured priority, white, and black lists. Non-threatening movements such as shadows or animals are filtered out.

Response: The operator receives a verified alarm in Talos, complete with bounding boxes showing exactly where the threat was detected.

GCXONE's AI reduces false alarms by approximately 80%, ensuring operators focus only on genuine security threats.

Key Automation Workflows

Arm/Disarm Schedules: GCXONE can automate the arming and disarming of sites based on client business hours. When the schedule reaches the arming time, GCXONE calls the device API and waits 30 seconds for a status confirmation. If the device fails to arm, an Arming Failure alert is sent to the operator.

Event Overflow Protection: To prevent system overload from faulty sensors, GCXONE implements overflow protection. If 25 or more alarms are received from a single sensor within 5 minutes, alarms are temporarily discarded and a maintenance ticket is generated automatically.
