Managing Users

Managing Users

Once users are onboarded, administrators can modify their permissions and client visibility as their responsibilities evolve.

Viewing and Searching Users

1. Go to Settings → Users.
2. Search Bar: Quickly find a user by their name or email.

Editing User Access

If a team member changes roles or needs to monitor new clients:

1. Go to Settings → Users.
2. Locate the user in the User List table.
3. Click the Actions (⋯) menu next to the user.
4. You will see three options:
   - **Edit User** — Update personal information, role, customer group, or session timeout.
   - **Edit User Entities** — Assign or modify which customers and sites this user can access using the entity tree with Override or Merge mode.
   - **Remove User** — Permanently remove the user from the platform.
5. Select **Edit User** to update the following:
   - First Name and Last Name
   - Email Address
   - Phone Number
   - Address Information
   - Genesis Role and GCXONE Role
   - Customer Group
   - Session Timeout
6. Click **Update User** to save changes.

To update entity access specifically, select **Edit User Entities** from the Actions menu. This opens the entity tree where you can assign customers and sites to the user using Override or Merge mode.

Permission changes take effect immediately. The user may need to refresh their browser tab to see new sidebar icons or client sites.

Remove User

When a user no longer needs access, locate the user in the User List table, click the Actions (⋯) menu, and select Remove User.

Removing a user permanently removes their record from the platform. The account cannot be restored after deletion.

Note: Use Remove User only when you are certain the user no longer needs access. For temporary access removal, consider updating their role to End User or restricting their entity access instead.

Security Best Practices

Quarterly Audits: Review your user list every 3 months. Remove or restrict access for anyone who hasn't logged in recently.

Offboarding: Remove user access the moment a team member leaves the organization.

Avoid Shared Accounts: Never share a single login between multiple people. This destroys your audit trail.
