Webhooks

Webhooks allow you to receive real-time notifications when events occur in your NXGEN environment. Configure endpoints to receive push notifications for alerts, device status changes, and other critical events.

Event Types

Available webhook event types: alert.created, alert.acknowledged, alert.resolved, station.created, station.updated, station.status_changed, device.created, device.updated, device.offline, device.online, data.threshold_exceeded.

Payload Format

All webhook payloads follow a consistent JSON structure with event type, timestamp, data, and metadata fields.

Security

Each webhook delivery includes an X-NXGEN-Signature header containing a HMAC-SHA256 signature of the payload. Verify this signature using your webhook secret to ensure authenticity.

Retry Policy

Failed deliveries are retried with exponential backoff: 1m, 5m, 15m, 1h, 6h, 24h. After 24 hours, the webhook is marked as failed.

Best Practices

Return 200 OK quickly, process asynchronously. Verify signatures, handle duplicates with idempotency keys, implement retry logic for your endpoint failures, and monitor delivery logs.
